# Microsoft Exchange Server Available

April 2, 1996 |

**LAS VEGAS, April 2, 1996** — Today at Network+Interop '96, Microsoft Corp. announced the availability of Microsoft® Exchange Server, the first integrated messaging and groupware server designed to provide users and system administrators with native open and secure access to the Internet.

Microsoft Exchange Server contains e-mail and built-in groupware to allow group scheduling, discussion databases, document sharing and other custom applications to improve business productivity. In addition, it enables system administrators to monitor and troubleshoot the messaging system of an entire corporation – including Internet mail connections and usage – from a single workstation.

Microsoft Exchange Server enhances the Microsoft BackOffice® family of server applications for distributed intranet and Internet computing, which is based on the Windows NT® operating system. It also has cross-platform support for other 16-bit and 32-bit operating systems.

More than 60,000 users at corporations, government agencies and universities have already deployed Microsoft Exchange Server. More than 130 software developers have or will announce compatible products, and 30 of these products are expected to ship within 90 days of the Microsoft Exchange ship date. In addition, 12,000 Microsoft Solution Providers (SPs) have been educated to support Microsoft Exchange.

"Today we are shipping a comprehensive messaging product with integrated groupware and Internet connectivity that will meet the needs of companies today and in the future,"

said Jim Allchin, senior vice president of Microsoft's desktop and business systems division.

"A dedicated development team's design goals for this product – reliability, performance and stability – ensure companies can bank their mission-critical business on it, and we have 40 early adopter companies who already have."

In addition to the external support for Microsoft Exchange, Microsoft offers several new services, including preventive support that provides continuous remote-server monitoring and server-restoration, and consultative migration and planning services to assist customers with the deployment of Microsoft Exchange.

**Internet Mail, X.400 Connectors and Application Development and Migration Tools Included**
